TR(I)

TR(I)

NAME

tr - transliterate

**SYNOPSIS** 

## DESCRIPTION

Tr copies the standard input to the standard output with substitution or deletion of selected characters. Input characters found in *string1* are mapped into the corresponding characters of *string2*.

Any combination of the options -cds may be used.

- -c complements the set of characters in *string1* with respect to the universe of characters whose ascii codes are 001 through 377 octal.
- -d deletes all input characters in *string1*.
- -s squeezes all strings of repeated output characters that are in *string2* to single characters.

The following abbreviation conventions may be used to introduce ranges of characters or repeated characters into the strings:

[a-b] stands for the string of characters whose ascii codes run from character a to character b.

[a\*n], where n is an integer or empty, stands for n-fold repetition of character a. n is taken to be octal or decimal according as its first digit is or is not zero. A zero or missing n is taken to be huge; this facility is useful for padding string2.

The escape character '\' may be used as in sh to remove special meaning from any character in a string. In addition, '\' followed by 1, 2 or 3 octal digits stands for the character whose ascii code is given by those digits.

The following example creates a list of all the words in 'file1' one per line in 'file2', where a word is taken to be a maximal string of alphabetics. The strings are quoted to protect the special characters from interpretation by the Shell; 012 is the ascii code for newline.

$$tr - cs "[A-Z][a-z]" "[\012*]" < file1 > file2$$

SEE ALSO

sh (I), ed (I), ascii (VII)

**BUGS** 

Won't handle ascii NUL in string1 or string2; always deletes NUL from input.
